Host a Website on Amazon S3

dhivyapriya Pandiyaraj

Introducing Today's Project!

Project overview

In this project, I will demonstrate a static website I'm doing this project to learn how to host a static website through Amazons3.

Tools and concepts

Services I used were S3 Key concepts I learnt include AWS S3, Bucket, Objects, Bucket policy, Bucket website endpoint, ACL, Hosting a static website in S3

Time, challenges, and wins

This project took me approximately 1/2 hour. The most challenging part was making the website host in S3. It was most rewarding to finally see the website load successfully with proper styling, images, and functionality after fixing the folder structure and upload issues.

How I Set Up an S3 Bucket

What I did in this step

In this step, I will create an S3 bucket and to host a static website because I need to host those website publicly

How long it took to create the bucket

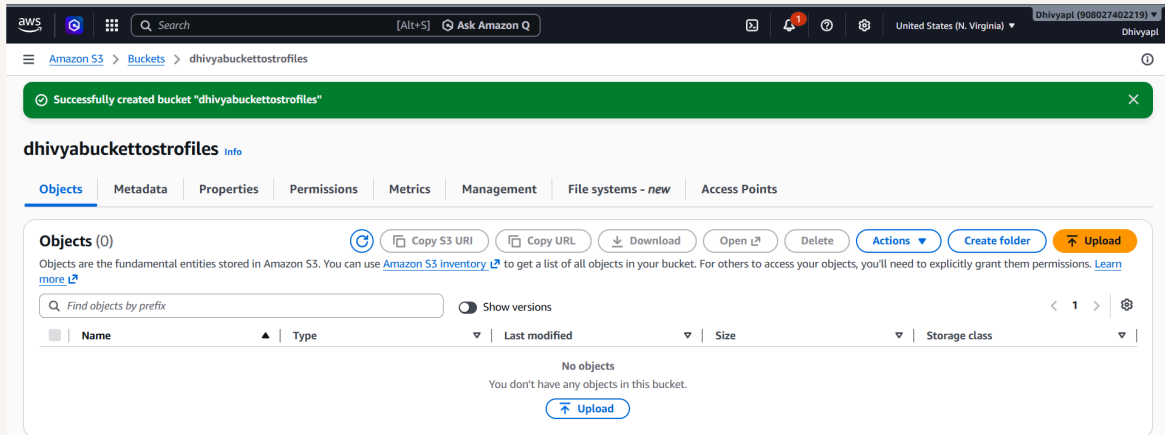

Creating an S3 bucket took me 10 mins by reading through the guidelines but if we do it for the 2nd time it will take around 2 mins

Region selection

The Region I picked for my S3 bucket was United States N. Virginia because I want to make this website accessible to US people so there will low latency

Understanding bucket name uniqueness

S3 bucket names are globally unique! This means the s3 name will be there in the URL so when ever u are trying to access the s3 it should be unique and those are Globally unique.

Upload Website Files to S3

What I did in this step

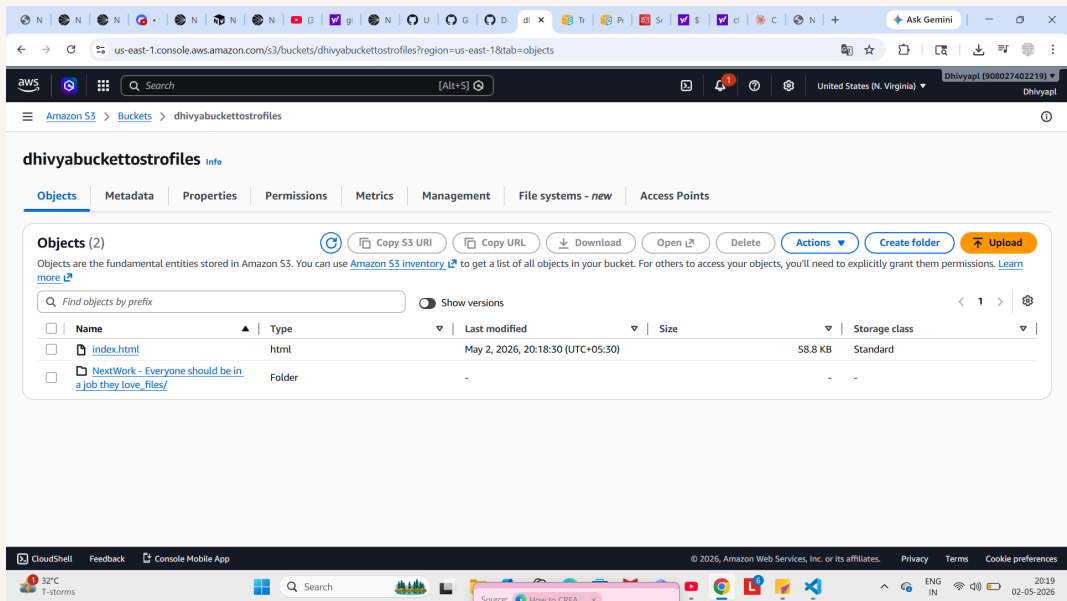

In this step, I will download the html file and thire required css, image and js files because to host the satic website in aws

Files I uploaded

I uploaded two files to my S3 bucket - they were index.html file and a folder that contains 43 files

How the files work together

Both files are necessary for this project as one has the raw htlm file and the other files are images and js files to show the content

Static Website Hosting on S3

What I did in this step

In this step, I will configure S3 bucket for static website hosting because we need to visit our public website link that has been hosted.

Understanding website hosting

Website hosting means making the content accessible to the public

How I enabled website hosting

To enable website hosting with my S3 bucket, I enabled the option that says enable website hosting...

Access Control Lists (ACLs)

An ACL (Access control list) is a set of rules which decides who can access the resource

Successfully edited static website hosting.

Tags

You can use tags to track storage costs, organize general purpose buckets, and specify permissions for a general purpose bucket. AWS-generated tags are created by AWS and are read-only. [Learn more](#)

S3 Console now uses s3:ListTagsForResource, s3:TagResource, and s3:UntagResource APIs to manage tags on S3 general purpose buckets by default. To use these APIs for tagging, please provide permissions to s3:ListTagsForResource, s3:TagResource, and s3:UntagResource actions. [Learn more](#)

Bucket Endpoints

Understanding bucket endpoint URLs

Once static website is enabled, S3 produces a bucket endpoint URL, which is a regular static website url it tells people visit your s3 bucket files as a website

What I saw when I tested the endpoint

When I first visited the bucket endpoint URL, I saw... The reason for this error was we haven't given permissions to the files that we have uploaded in the bucket. To solve this error we need to set the permission of the objects to public this is why we enabled ACL

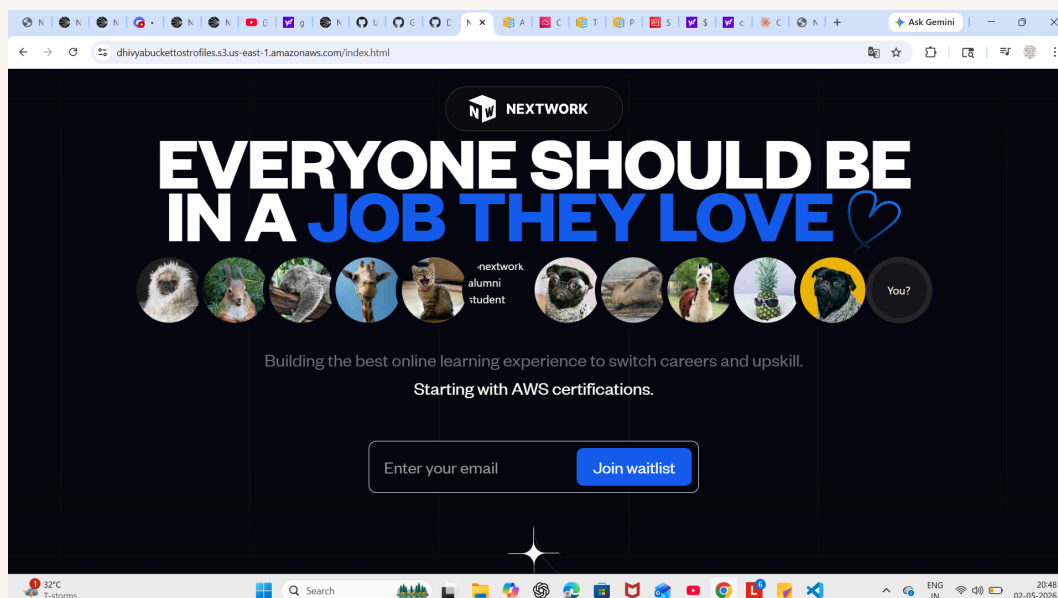

Success!

What I did in this step

In this step, I will make the website publicly accessible and because we can see our website live on the internet

How I resolved the 403 error

To resolve this 403 Forbidden error, I enabled the option make publicly accessible through ACL

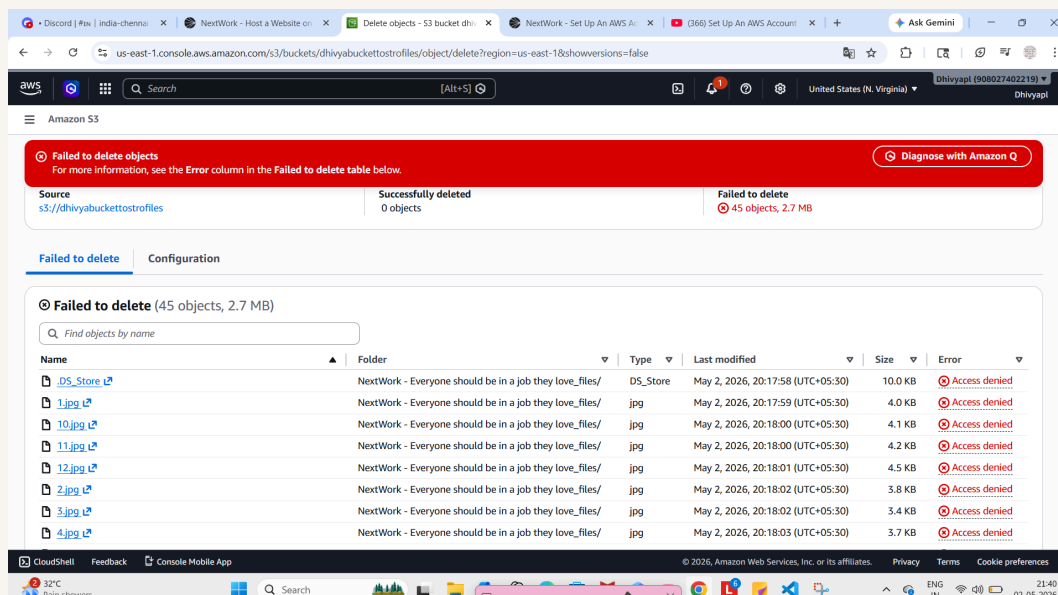

Bucket Policies

What I did in this extension

In this project extension I'm about to create an Bucket policy... I'm doing this so that no one can delete my File on bucket

Understanding bucket policies

An alternative to ACLs are bucket policies, which are used to give specific and dedicated permissions. The benefit of using bucket policies is to set permissions like who can modify or delete the objects...while ACLs are useful for giving quick permission not specific one.

What my bucket policy does

My bucket policy makes my files not to delete by anyone I tested this by trying to delete and saw an error that could not delete.
